Contents

Background & Motivation

Geoboŋ is a conlang spoken by a race of goblins in my as-of-yet-unnamed conworld. As goblins are sort of an underclass, their language will always be in a semi-precarious diglossic situation, and in the future I hope to add some fun diachronic interactions with the other languages from this conworld.

This language is intended to have some deliberately weird elements (particularly with its syntactic alignment) yet still retain a veneer of quasi-naturalism—while naturalism is definitely a concern, it can be discarded for the sake of trying out something fun.

1 Phonology

1.1 Phoneme Inventory

	Bilabial	Laminodental		Apical		Palatal	Velar	Glottal
		Non-Sibilant	Sibilant	Non-Sibilant	Sibilant			
Nasal	m	n̪		n̺		ɲ	ŋ	
Stop	p b	t̪ d̪	t͡ʂ d͡ʐ	t̺ d̺	t͡ʂ d͡ʐ	c͡ç ɟ͡ʝ	k g	ʔ
Fricative		ɬ̪	s̺	ɬ̺	s̺	ç		
Approximant		ɹ̪̊ l̪		ɹ̺̊ l̺				

Table 1: Consonants

	Front	Back	
		Unrounded	Rounded
High	i	ɯ	u
Mid-High	e	ɤ	o

Table 2: Vowels

The utter lack of phonemically open vowels in Geoboŋ could be considered strange. Geoboŋ does historically possess a phonemic /a/; however, whether it can be considered a distinct phoneme in the current language is not clear, as it does occur phonetically in any position in which it contrasts with /ɤ/. One could analyze Geoboŋ as possessing an /a/ which does not appear phonetically but causes a following sonorant or continuant to serve as the syllabic nucleus of the relevant syllable. Under this analysis, /a/ has merged with /ɤ/ when not followed by a sonorant or continuant, as its realizations [a~ɐ~ɜ] do not meaningfully contrast with any of /ɤ/'s realizations and tend to be interpreted as /ɤ/ by speakers.

1.2 Syllable Structure

The analysis one takes of Geoboŋ syllable structure depends on whether one analyzes it as possessing the underlying /a/ phoneme that is never explicitly realized. If one posits the existence of this phoneme, the language's syllable structure can be analyzed as follows:

$$(S)(C)(R)V(R)(C)$$

C: any consonant
S: sibilant fricative
R: any consonant that isn't a stop

In order for the above analysis to hold, one must posit that the phoneme /a/ disappears and causes any following non-stop consonant to become syllabic, while simultaneously never occuring before stops.
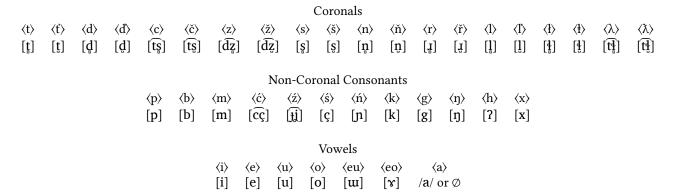

If one does not analyze Geoboŋ as possessing /a/, the analysis of its syllable structure becomes necessarily more complicated to account for its bevy of syllabic consonants. In such an analysis, one must posit that, when the nucleus is a vowel, the above structure holds, but that when the nucleus is a syllabic consonant, the structure is instead (S)(C)(R)R(C).

Regardless of which of these analyses one finds the most appealing, a few other constraints on both onset and coda clusters are applicable. While Geoboŋ's sonority hierarchy is generally quite permissive, fricatives cannot be preceded by approximants in onset clusters, and the reverse cannot occur in coda clusters.

1.3 Allophony

1. Coronal consonants persistently assimilate in laminarity to the following consonant.

   - syllabic consonants included
   - reflected in orthography

2. Sibilants become alveolopalatal after a palatal & palatal obstruents become alveolopalatal after a sibilant

   - syllabic consonants included
   - *not* reflected in orthography

3. Palatals become velar when they precede a non-palatal consonant

   - syllabic consonants *not* included
   - *not* reflected in orthography

4. Velars and non-sibilant coronals are palatalized before a palatal consonant

   - syllabic consonants included
   - *not* reflected in orthography

5. Obstruents persistently assimilate in voice to a following obstruent

   - syllabic consonants included
   - reflected in orthography

6. Nasals assimilate in POA to a following plosive or nasal

   - syllabic consonants *not* included
   - reflected in orthography

7. Nasals become partially-voiced non-nasal stops before a voiceless obstruent

   - only applies to non-syllabic nasals
   - only reflected in orthography when it occurs due to productive *derivational* morphology, not when it occurs within a root or due to inflection

8. Coronal obstruents assimilate in sibilancy to a following fricative. Before a non-sibilant fricative, sibilant obstruents become lateral. Before a sibilant fricative, non-affricate stops become affricates

   - syllabic consonants *not* included
   - reflected in orthography

9. Two of the same consonant in a row merge into a single occurrence of that consonant. Fricatives following affricates at the same place of articulation are also deleted. Partially-voiced stops absorb following voiceless stops at the same place of articulation.

   - syllabic consonants included
   - reflected in orthography

10. Lateral fricatives cannot be adjacent to lateral approximants

    - if the approximant's placement violates the sonority hierarchy (if they are in the same syllable and it occurs before the fricative in the onset or after the fricative in the coda), the approximant is deleted
    - if they meet at a syllable boundary, they merge and the resulting phone takes on the voicing of the latter and the manner of articulation of the former
    - otherwise, the lateral fricative is realized as a velar non-lateral fricative
    - reflected in orthography, but [ɮ] and [ḷ] are still represented as clusters

1.4 Orthography

Coronals

⟨t⟩	⟨t́⟩	⟨d⟩	⟨d́⟩	⟨c⟩	⟨č⟩	⟨z⟩	⟨ž⟩	⟨s⟩	⟨š⟩	⟨n⟩	⟨ň⟩	⟨r⟩	⟨ř⟩	⟨l⟩	⟨ĺ⟩	⟨ł⟩	⟨ɬ⟩	⟨λ⟩	⟨λ́⟩

[i]	[e]	[u]	[o]	[ɯ]	[ɤ]	/a/ or ∅

2 Syntax

2.1 Animacy

Geoboŋ has six noun classes. Which class a noun belongs to is based almost entirely on the lexical animacy of the noun in question. These classes form an animacy hierarchy. In Geoboŋ's parent language (known as *Cokizboŋ*, lit. 'finish language', to the goblins) this animacy hierarchy was fairly central to much of the morphosyntax, as it was a direct-inverse language. Modern Geoboŋ only shows remnants of this hierarchy in the verbal morphology, but the six third-person noun classes are still very fundamentally present in the language's morphosyntax.

0	1st & 2nd Person
1	Natural Forces
2	Non-Goblin Intelligent Creatures
3	Goblins
4	Living Animals
5	Inanimate Objects
6	Abstract Concepts

Table 3: Animacy Hierarchy

As one of the few relics of the animacy hierarchy, there are different morphemes for verbal negation depending on the noun classes of the subject and object. If the subject is equal to or higher on the animacy hierarchy than the object, the affix *-(o)keo-* is placed directly after the root. If the subject is lower on the animacy hierarchy than the object, the affix *-ogź(u)-* is used instead.

(1) a. *Geob   teď bol -keo   -g*
         goblin 1   strike-NEG.DIR->3.GOB

         'I didn't hit a goblin.'

     b. *Geob   teď bol -ogź   -eď*
         goblin 1   strike-NEG.INV->1

         'A goblin didn't hit me.'

2.2 Verbal Morphology

Verbs in Geoboŋ are suffixed with a marker for person and animacy. These markers originate from pronouns that used to be placed after the verb and thus resemble reduced forms of those pronouns.

	1st	2nd	NT-FRC	NG-INT	GOB	ANIML	INAN	ABSTR
Suffix[1]	*-eď, -ď*	*-ar, -r*	*-aň, -ň*	*-meu*	*-eog, -g*[2]	*-šu*	*-im, -m*[3]	*-es, -s*[4]
Pronoun	*teď*	*kar*	*teuň*	*ameu*	*eog*	*šu*	*him*	*es*
Reflexive[5]	*teteď*	*karkar*	*teudteuň*	*meum*	*geog*	*šuš*	*himim*	*ses*

Table 4: Person/Animacy Markers

These markers agree in person and animacy with the syntactic *object* rather than the subject—that is, the more patientlike P argument rather than the more agentlike A argument (though the semantic roles these syntactic roles fill can obviously vary significantly depending on both the verb in question and the context).

If both the subject and object are of the same noun class and it is thus ambiguous which entity in the sentence the agreement marking is referring to, the appropriate standalone pronoun can be placed directly after the subject. However, this is only done if the sentence would be obviously ambiguous otherwise.

(2) *Ałk šu   dež boľ -šu*
     dog 3.ANIML cat strike->3.ANIML

     'The dog hit the cat.'

Agreement with the syntactic P argument naturally leads to the question of what (if any) markings verbs take if the verb is intransitive. The simple answer is that Geoboŋ lacks true syntactic intransitives entirely. Rather, several different constructions are used as workarounds so that otherwise transitive Geoboŋ verbs can express typically-intransitive meanings.

For verbs in which the single argument does not initiate or is not actively responsible for the action of the verb, the most common solution is to use the abstract pronoun *es* as a dummy subject, similar to how English would use 'there' or 'it' in certain types of clauses.

(3) *Geob   es   łemp-eog*
     goblin 3.ABSTR trip ->3.GOB

     'The goblin trips.' (lit., 'It trips the goblin.')

There does not have to be an unspoken agent or cause of the action described by the verb for this structure to work—the purest of statives with no actual cause can also be represented by this structure.

(4) *Beu   es   kał-im*
     berry 3.ABSTR red->3.INAN

     'The berry is red.' (lit., 'It reddens the berry.')

Many verbs, particularly those of position and motion, contrast this dummy-subject structure with another that uses reflexive pronouns. For these verbs, use of a reflexive pronoun as the subject indicates a dynamic reading, while the dummy-subject structure indicates a stative reading.

(5) a. *Geob   es   ot -eog*
         goblin 3.ABSTR sit->3.GOB

         'The goblin is sitting.' (lit., 'It seats the goblin.')

     b. *Geob   geog   ot -eog*
         goblin 3.GOB.REFL sit->3.GOB

         'The goblin sits down.' (lit., 'Himself seats the goblin.')

---

[1]When multiple suffixes are listed, the former is used when the suffix follows a non-syllabic consonant and the latter when it follows a syllabic consonant or vowel unless otherwise indicated

[2]If the latter suffix is used following a front vowel, that vowel is backed.

[3]If the latter suffix is used following a back vowel, that vowel is fronted. Fronting of rounded vowels is allophonic and not reflected orthographically.

[4]Unlike the other listed suffixes, for the abstract noun class the latter vowelless allomorph is only used following a true vowel, and the former suffix is used following a syllabic consonant.

[5]Perhaps abnormally, reflexive forms for pronouns are used as subject pronouns rather than object pronouns

As evidenced by the use of the dummy-subject strategy for a verb like 'to sit', it doesn't take much for an argument to be considered sufficiently un-agent-like for that strategy. Indeed, only the most prototypical agents are not captured by this strategy.

For would-be intransitive verbs where the argument explicitly represents an agent, there is yet another strategy. One can nominalize the main verb adding the suffix -stu to the root, and then treat this nominalized verb as the object of the verb śe 'to do, to make'.

(6) *Řim-stu geob śe -s*
run -NMZ goblin do->3.ABSTR

'The goblin is running.' (lit., 'The goblin does running.')

For certain motion verbs, both the nominalization and reflexive strategies are both appropriate. In this case, the former allows the speaker to put the action in focus in a way that cannot be done when the action is not nominalized, as in the reflexive strategy (see section 2.7 for more on focus marking). In addition, the former carries connotations of duration/ongoingness, while the latter is more explicitly inchoative. Compare (6) with (7):

(7) *Geob geog řim-eog*
goblin 3.GOB.REFL run->3.GOB

'The goblin gets himself running.'

The reflexive strategy is not necessarily appropriate for all would-be intransitives, however, as for many (if not most) verbs, it simply carries the expected reflexive meaning.

(8) *Karkar bol -ar*
2.REFL strike->2

'You're hitting yourself.' (*not* 'You're getting yourself to hit things.')

2.3 Possession & Quantification

As Geoboŋ is head-marking, in a possession scenario it is the possessed noun that is inflected. A possessive affix -(a)ł- is added to the end of the possessed noun and then followed by a suffix that agrees in person and number with its possessor. The possessor, if specified, is placed before the possessed noun.

(9) *Ňuńoh meo -ł -meu*
elf mother-POSS-3.NGINT

'The elf's mother'

This syntactic structure is also used more broadly, however, for quantification. Perhaps counterintuitively, the quantified noun is treated as the possessor of the noun indicating the relevant quantity.

(10) *Ďeoś euś-ał -m*
tree all -POSS-3.INAN

'all of the trees' (lit., 'the tree's everything')

This is not limited to more ambiguous quantifiers—it is used for numbers as well.

(11) *Ďeoś zlic -ał -m*
tree three-POSS-3.INAN

'three trees' (lit., 'the tree's three')

This use of quantifiers is one of Geoboŋ's main methods of compensating for the fact that it does not mark for number whatsoever, even in pronouns. If a speaker wants to pluralize a pronoun (for instance, saying 'we') that speaker can simply use the quantifier inflected for the relevant person and animacy (such as *euśałď* 'all of me/us').

To quantify over verbs (i.e., to say something happened 'twice' or 'many times'), one must quantify over the object. This is true even if the object seems to be something unquantifiable, such as an abstract noun or nominalized verb.

(12) *Řim-stu kle -ł   -es   teď śe -s*
    run -NMZ two-POSS-3.ABSTR 1   do->3.ABSTR

    'I ran twice.' (lit., 'I did two running.')

Distinguishing between whether a quantifier on the object semantically indicates quantification over the object or the verb is only done if context does not make it clear which is meant, but can be done using adjectives and embedding quantifiers under one another.

(13) a. *Ďerŋ   šřeoď kle -ł   -im   teď řu -m*
       different eel   two-POSS-3.INAN 1   cook->3.INAN

    'I cooked two different eels.'

   b. *Šřeoď dań-ał -m   kle -ł   -es   teď řu -m*
       eel   one-POSS-3.INAN two-POSS-3.ABSTR 1   cook->3.INAN

    'I cooked one eel twice.'

2.4 Postpositions

Postpositions follow their nouns and inflect to agree with their objects. Their endings are identical to those used for verbs.

(14) *Ťńeľ čo -m*
    stick INS-3.INAN

    'with a stick'

If the postposition would only be preceded by a pronoun, it can be omitted and the inflected postposition used on its own as a whole phrase.

(15) *Ŋi   -ď ňuńoh meum   řim-eu*
    away.from-1 elf   3.NGINT.REFL run->3.NGINT

    'The elf ran away from me.'

In addition to traditional postpositions, Geoboŋ demonstratives are also realized as postpositions. Since postpositional phrases cannot be embedded within each other, one cannot use an explicit demonstrative with a noun that is already part of a postpositional phrase.

(16) a. *Ŋuž uď -im   kar boš-im*
       fish MED-3.INAN 2   eat->3.INAN

    'You ate that fish.'

   b. *Ŋuž čo -m   kar bol -eď*
       fish INS-3.INAN 2   strike->1

    'You hit me with a fish.'

   c. **Ŋuž uďim čom kar boleď*
      (Intended: 'You hit me with that fish.')

   d. **Ŋuž čom uďim kar boleď*
      (Intended: 'You hit me with that fish.')

This does not otherwise change the syntactic behavior of the noun—if the argument in question is the object without the demonstrative postposition, it remains the syntactic object and verbal agreement still takes place.

2.5 Ditransitives

Geoboŋ is secundative, so for inherently ditransitive verbs like *ćneu* 'to give', the syntactic object of the verb is the recipient. The theme can be included as a postpositional argument using the instrumental *čo*.

(17)   *Meo   -ł   -eď geob   dež čo -šu   ćneu-meu*
           mother-POSS-1   goblin   cat   INS-3.ANIML   give ->3.NGINT

         'The goblin gave my mother a cat.'

Benefactive ditransitives can be derived from many verbs that are not inherently ditransitive by addition of the affix *-tu-* before the agreement suffix but after the negation affix (if any).

(18)   *Meo   -ł   -ar teď šřeoď čo -m   řu -keo   -tu -g*
           mother-POSS-2   1   eel   INS-3.INAN   cook-NEG.DIR-BEN->3.GOB

         'I won't cook eel for your mother.'

Since the theme is optional in these 'ditransitives', this is also an effective way of describing an action in which the theme is unknown or unspecified, effectively serving as another argument-reduction strategy.

(19)   *Meo   -ł   -eog   Škrik   eog   deňře-tu -g*
           mother-POSS-3.GOB Skreek   3.GOB   sing -BEN->3.GOB

         'Skreek sings for his mother.'

2.6 Adjectives

Strictly speaking, there is not a separate syntactic class known as 'adjectives' in Geoboŋ. However, the equivalent of adjectives are realized by adverbs or uninflected verbs placed directly before the nouns they modify.

(20)   a.   *Ćreź ťńeľ*
           alive   stick

          'Flourishing branch'

      b.   *Ťńel   ban   ćreź -im*
           stick   sun   alive->3.INAN

          'The sun made the branch flourish.'

In more complex NPs containing possession or quantification, the location of the adjective can affect the meaning of a phrase.

(21)   a.   *Ćreź ťńeľ   dań-ał   -m*
           alive   stick   one-POSS-3.INAN

          'One of the flourishing branches'

      b.   *Ťńeľ ćreź   dań-ał   -m*
           stick   alive   one-POSS-3.INAN

          'The flourishing one of the branches'

As we've already seen in earlier examples, originally causative verbs can serve practically as predicative adjectives when inflected with a dummy subject

(22)   *Ŋuž es   nonoň -šu*
           fish   3.ABSTR   enlarge->3.ANIML

         'The fish is big.' (lit., 'It enlargens the fish.')

Geoboŋ lacks separate comparative forms of the verb. In order to make predicative comparisons, the verb is turned into a benefactive ditranstive using the affix *-tu-*. The 'lesser' of the compared items then serves as the syntactic object of the verb,

with the 'greater' item as the optional instrumental argument, and the dummy pronoun remains the syntactic subject.

(23)   *Reu -ł   -eď es   ŋiž čo -šu   nonon -tu -m*
          house-POSS-1   3.ABSTR fish INS-3.ANIML enlarge-BEN->3.INAN

          'The fish is bigger than my house.' (lit., 'It enlarges the fish for my house.')

Note that the verb still agrees with the syntactic object, so unlike in the non-comparative example, the verb agrees with the noun that is less well-described by the adjective in question. This means that in such comparisons, the standard of comparison cannot be omitted.

2.7   Focus & Word Order

To the casual observer, Geoboŋ seems superficially OSV. While it is true that this pattern is certainly the most commonly seen in the language, the reality is more complicated. This typical ordering is actually due to the focus marking that lies at the core of Geoboŋ sentence structure.

In any given sentence, whichever argument is the focus is moved to a sentence-initial position.

(24)   *Ałk Škrik   boľ   -šu*
          dog Skreek strike>3.ANIML

          'It was the dog that Skreek hit.'

(25)   *Škrik   ałk boľ   -šu*
          Skreek dog strike->3.ANIML

          'It was Skreek who hit the dog.'

Before this movement, the sentence is underlyingly SOV, so if a complement other than the subject or object is the focus, this is the order in which those arguments will appear.

(26)   *Ťňeľ čom   Škrik ałk boľšu*
          stick INS:3.INAN Skreek dog strike:>3.ANIML

          'It was with a stick that Skreek hit the dog.'

Only arguments can be fronted like this, so if the verb or an adjunct is the focus, the object is moved to this position in their stead.

(27)   Q: 'When did Skreek hit the dog?'

       a.   **Daś   Škrik ałk boľšu*
            yesterday Skreek dog strike:>3.ANIML

       b.   *Ałk Škrik   daś   boľšu*
            dog Skreek yesterday strike:>3.ANIML

            A: 'Skreek hit the dog yesterday.'

If the object is not in focus and would be represented with a pronoun, it can be omitted from the sentence. However, this is not the case with any other argument (i.e., subjects must always be explicitly included).

(28)   A: *Ałk Škrik daś boľšu.* ('Skreek hit a dog yesterday.')
          B: *Ńeł?* ('Really?')

          Ip ťňeľ čom   eog   boľšu
          yes stick INS:3.INAN 3.GOB strike:>3.ANIML

          'Yes, it was with a stick that he hit (it).'

2.8 Relative Clauses

Geoboŋ relative clauses are formed via adjoined clauses. The relativized noun must be fronted in both clauses, and therefore only arguments can be relativized. The complementizer *deoł* is placed clause-initially in the relativized clause, which is then directly followed by the main clause. The argument in question can be either restated in the main clause (often with a demonstrative) or replaced with a pronoun.

(29) a. *Deoł oh teď žeźeog , oh ńoďeog reu eumim*
c person 1 see:>3.GOB person DIST:3.GOB home go.to:>3.INAN

b. *Deoł oh teď žeźeog eog reu eumim*
c person 1 see:>3.GOB 3.GOB home go.to:>3.INAN

'The person who I saw went home.'

The order of the relativized and main clause is determined by whether the relative clause is restrictive or not. In restrictive relative clauses, the relative clause precedes the main clause, while in non-restrictive relative clauses, the relative clause occurs afterwards.

(30) *Meołeď reu eumim , deoł eog geob žeog*
mother:POSS:1 home go.to:>3.INAN c 3.GOB goblin COP:>3.GOB

'My mother, who is a goblin, went home.'

Content clauses, in which the subordinate clause serves as an argument of the main sentence, are expressed using relative clauses modifying the dummy noun *as*. Historically, *as* could be roughly translated 'case, situation, affair', but in the modern language it is not used outside of the formation of content clauses

(31) *Deoł geob meołar žeog , as teď žeźes*
c goblin mother:POSS:2 COP:>3.GOB c 1 see:>3.ABSTR

'I saw that your mother is a goblin.' (lit., 'I saw the fact that your mother is a goblin.')

Most other subordinating conjunctions in English are approximated by using the above strategy combined with various prepositions or verbs.

(32) *Deoł dizd ŋuž pidim , as euźdes teď boškem*
c salt fish possess:>3.INAN c due_to:3.ABSTR 1 consume:NEG.DIR:>3.INAN

'I didn't eat the fish because it was salty.' (lit., 'Due to the fact that the fish had salt, I didn't eat it.')

3 Semantics

3.1 TAM Particles

Geoboŋ is tenseless, only specifying tense if doing so is necessary in context and doing so using temporal adverbs, which are typically placed before the verb.

(33) a. *bostu teď daś śes*
eat:NMZ 1 yesterday do:>3.ABSTR

'I ate yesterday.'

b. *bostu teď šaľň śes*
eat:NMZ 1 someday do:>3.ABSTR

'I'll eat later.'

In addition to adverbs, Geoboŋ also possesses several particles that indicate aspect, mood, or some combination thereof. These are distinct from ordinary adverbs in that they come after the verb rather than beforehand.

3.1.1 Gnomic—*go*

The gnomic particle *go* is placed after the verb when the predicate describes a general truth, something that always holds true.

(34)   *Euŋr es   peodaň   go*
       sky   3.ABSTR   blue:>3.NTFRC   GNO

       'The sky is blue'

It's also often exaggeratedly used to simply mean 'always' or to describe habitual actions that still go on in the present.

(35)   *Ŋuž kar řum   go   !*
       fish   2   cook:>3.INAN   GNO

       'You *always* cook fish!'

Since TAM particles scope over negation, applying *go* to a sentence in containing negation turns this 'always' into a 'never'. If one wants to scope negation over the gnomic particle, the whole clause must be embedded under a negative verb.

(36)   a.   *Ŋuž meo   řukem   go*
           fish   mother   cook:NEG.DIR:>3.INAN   GNO

           'Mom never cooks fish.'

       b.   *Deoł ŋuž teď řum   go   , as es   hisŋkeos*
           C   fish   1   cook:>3.INAN   GNO   C   3.ABSTR   real:NEG.DIR:>3.ABSTR

           'It's not the case that I always cook fish.'

3.1.2 Completive—*ośk*

The completive particle *ośk* is used when discussing an eventuality that has already occurred in relation to the time being discussed. It can often be translated with the English perfect or with the word 'already'.

(37)   *Bostu   teď śes   ośk*
       eat:NMZ   1   do:>3.ABSTR   CMPL

       'I've already eaten/drunk.'

When used with a negative verb, it can be more accurately translated as 'still haven't.'

(38)   *Bostu   teď śekeos   ośk*
       eat:NMZ   1   do:NEG.DIR:>3.ABSTR   CMPL

       'You still haven't eaten.'

3.1.3 Retrospective Habitual—*pu*

The retrospective habitual particle *pu* is used to describe an eventuality that was once generally, habitually, or always the case, but has since ceased to be. It's usually best translated with 'used to', 'once', or 'would X' in English.

(39)   *Ŋuž teď řum   pu*
       fish   1   cook:>3.INAN   RHAB

       'I used to cook fish' (but I've since stopped for some reason)

This particle scopes over negation, so using it with a negative verb conveys that it used to be the case that they generally did not do a thing, but that now they do that thing (or at least have done so once). To merely negate the habituality of an action, one must embed the whole clause under a negative verb, just as one must do to force negation to scope over the gnomic particle.

(40) a. *Šřeoď teď bolkeošu   pu*
          snake 1   strike:NEG.DIR:>3.ANIML RHAB

      'I used to never fight snakes.' (but now I've started doing it)

  b. *Deoł šřeoď teď boľšu   pu   , as es   hisŋkeos*
      C   snake 1   strike:>3.ANIML RHAB   C   3.ABSTR real:NEG.DIR:>3.ABSTR

      'I didn't used to fight snakes.' (I never stopped fighting snakes!)

3.1.4 Change-of-state—*ľi*

The change-of-state particle *ľi* indicates that an eventuality is new or novel in some way, a change to the previous status-quo.

(41) *Šřeoď źreoňžeog   go eo eog zdeušu   ľi*
      snake scare:>3.GOB GNO and 3.GOB bite:>3.ANIML COS

      'Snakes scare him, but he bit (one)!'

It's often contrasted with a status quo or former status quo expressed with the gnomic or retrospective habitual particles. However, there is no requirement that they be paired together; the change-of-state particle can be used on its own to merely imply the departure from the status quo without making the status quo itself explicit.

(42) *Ŋuž teď bošim   ľi*
      fish 1   eat:>3.INAN COS

      'I eat fish now' (we both know I used to be a vegetarian)

In these contexts, it's often translated with 'now' or 'anymore'.

By extension, some use this particle whenever a statement contradicts a previous statement, though the acceptability of doing this varies by region. Those who use it this way treat it as a discourse particle rather than a TAM particle, allowing it to be preceded by some other TAM particles.

(43) ?*Ŋuž Škrik boškem   pu   eo šřeoď eog bošim   go ľi*
       fish Skreek eat:NEG.DIR:>3.INAN RHAB and eel 3.GOB eat:>3.INAN GNO COS

      'Skreek never used to eat fish but he's always eaten eels.'

This usage of *ľi* is fairly novel however and even in the regions in which it's accepted, it's seen as dialectical.

3.1.5 Possibility—*ži*

The possibility particle *ži* indicates that an event is possible. It generally only represents circumstantial or epistemic possibility, though it can take on a deontic flavor if combined with *řo* (see 3.2.2). No obvious distinction is made between epistemic and circumstantial possibility in Geoboŋ, so which the speaker intends must be decided based on context alone.

(44) a. Q: What can Skreek cook?

      A: *Ŋuž eog   řum   ži*
         fish 3.GOB cook:>3.INAN PSBL

      'He is able to cook fish.'

  b. Q: What do you think Skreek is doing right now?

      A: *Ŋuž eog   řum   ži*
         fish 3.GOB cook:>3.INAN PSBL

      'He could be cooking fish.'

3.2 Discourse Particles

In addition to the particles indicating TAM, Geoboŋ possess a series of more discourse-focused particles which indicate the attitude of the speaker towards the propositional content of their utterance—they tend to communicate the illocutionary rather than locutionary act. They always occur sentence-finally, following even the TAM particles if any are present.

3.2.1 Question—*ńeł*

The question particle *ńeł* is appended to the end of a sentence when the sentence is a yes/no question. It's also used to ask what would be considered a tag question in English, wherein the speaker believes what they're saying is true and is seeking agreement. Intonation often plays a role.

(45) *Meołar   reu   eumim   ośk   ńeł*
      mother:POSS:2 home go_to:>3.INAN CMPL Q

      'Did your mother already go home?' or 'Your mother already went home, right?'

Note that *ńeł* is only used if the speaker is seeking information or agreement—while yes/no questions are often used for other illocutionary acts in other languages, these are indicated by different particles in Geoboŋ. The above sentence would not be used, for instance, if the question was actually intended as a request for the listener to send their mother home.

Ńel can also be used for embedded questions, serving as an equivalent to the English 'whether'

(46) *Deoł meołar   reu   eumim   ośk   ńeł , as teď tľirckeos*
      C   mother:POSS:2 home go_to:>3.INAN CMPL Q   C   1   know:NEG.DIR:>3.ABSTR

      'I don't know whether your mother already went home.'

Emphatic questions can be unambiguously asked by turning the entire clause, including *ńeł*, into an embedded question under a verb directly questioning the truth of the utterance, essentially doubling-up on the questioning nature of the utterance.

(47) *Deoł meołar   reu   eumim   ośk   ńeł , as es hisnes   ńeł*
      C   mother:POSS:2 home go_to:>3.INAN CMPL Q   C   ES real:>3.ABSTR Q

      'Did your mother already go home?' (lit., 'Is it true whether your mother already went home?')

This is generally seen as quite forceful and is thus impolite outside of very casual or very formal situations.

Ńeł is also often used on its own as a dialogue filler to ellicit agreement or encourage elaboration, much like the English 'right?', 'uh-huh?', or 'really?'

3.2.2 Request—*řo*

The request particle is appended to the end of a sentence when the speaker wants to turn the sentence into a request or suggestion for action. Often this manifests as it being directly appended to the end of a clause describing the content of the request:

(48) *Disd čom   kar ćneuď řo*
      salt INS:3.INAN 2   give:>1 REQ

      'Would you please hand me the salt?' or 'How about you hand me the salt?'

However, it can also be used with shorter utterances, even appended simply to the end of a noun if the context is right.

(49) *Disd řo*
      salt REQ

      'Salt, please?' or 'How about the salt?'

It can be even further abstracted, used with sentences that do not directly reference the requested eventuality whatsoever and only imply what the request itself actually is.

(50) *Meołar   reu   eumim   řo*
    mother:POSS:2 home go_to:>3.INAN REQ

    'Your mother went home, hint-hint.'

Like all discourse particles, *řo* scopes over negation. In order to negate a request rather than turning the sentence into a request for the negative, one must negate the verb *řoś* and embed the request under it.

(51) *Deoł disd čom   kar ćneuď řo , as čos   teď řośogźar*
    C   salt INS:3.INAN 2 give:>1 REQ C INS:3.ABSTR 1 request:NEG.INV:>2

    'I'm not asking you to pass me the salt.'

3.2.3 Command—*ďet*

The command particle *ďet* is appended to the end of a sentence to indicate that the speaker is commanding the hearer to do something. It is essentially a more forceful version of *řo*.

(52) *Disd čom   kar ćneuď ďet*
    salt INS:3.INAN 2 give:>1 IMP

    'Hand me the salt!'

Unlike *řo*, however, *ďet* cannot be used for negative commands/prohibitions.

(53) a. *Disd čom   kar ćneukeoď   řo*
       salt INS:3.INAN 2 give:NEG.DIR:>1 REQ

       'Please don't hand me the salt.'

    b. #*Disd čom   kar ćneukeoď   ďet*
        salt INS:3.INAN 2 give:NEG.DIR:>1 IMP

       Intended: 'Don't hand me the salt!'

Just like *řo*, *ďet* can be appended to a mere noun as an order for that noun and can be appended to more opaque utterances depending on context.

(54) *Bostu dež łeoλokeom   ďet*
    food cat have:NEG.DIR:>3.INAN IMP

    'The cat doesn't have food (Feed the cat!)'

Negation can scope over the command particle using the verb *ďetś* 'to command'. However, since simply using the command particle with a negative verb doesn't necessarily lead to a prohibitive meaning as one would expect were the imperative to scope over the negation, many speakers use that construction and treat the negation as scoping over the imperative.

(55) a. *Deoł dež kar arcšu   ďet , as čos   es   ďetśogźar*
       C   cat 2 feed:>3.ANIML IMP C INS:3.ABSTR 3.ABSTR command:NEG.INV:>2

    b. ?*Dež kar arckeošu   ďet*
        cat 2 feed:NEG.DIR:>3.ANIML IMP

       'You don't have to feed the cat.'

The latter construction is seen as childish and 'incorrect', but the former is seen as somewhat stilted and formal, so which is chosen largely depends on the context.

3.2.4 Prohibitive—*iz*

The prohibitive particle *iz* is appended to the end of a sentence to indicate that the speaker forbids the hearer from doing something. Usually, it'll be something referred to directly by the sentence the particle is attached to, though it doesn't

necessarily have to directly be the proposition expressed by the rest of the clause.

(56) *Ŋuž kar bošim   iz*
fish 2   eat:>3.INAN PROH

'Don't eat the fish!'

Like the other deontic particles, it can be used with a single noun, indicating that the hearer should avoid or not interact with that particular noun (in whatever way is context appropriate). It can also be used more obliquely, prohibiting something more indirectly related to the clause it's attached to

(57) *Ŋuž teď bošim   iz*
fish 1   eat:>3.INAN PROH

'Don't make me eat fish!'

Related constructions formed with *iz* can often approximate the meanings of other discourse particles, though usually with differences in affect or formality. Like other discourse particles, *iz* scopes over negation, and therefore using it with a negative verb can be interpreted as an imperative.

(58) *Ŋuž kar boškem   iz*
fish 2   eat:NEG.DIR:>3.INAN PROH

'You've got to eat the fish!' (lit., 'You mustn't not eat the fish')

However, this construction can be seen as awkward in many contexts, as it is often blocked by *ďet*, so it's used sparingly if ever by many speakers.

Negation can scope over the prohibitive using the verb *iłś* 'to forbid', which behaves essentially like a permissive.

(59) *Deoł ŋuž kar bošim   iz   , as čos   es   iłśogźar*
C   fish 2   eat:>3.INAN PROH   C INS:3.ABSTR 3.ABSTR forbid:NEG.INV:>2

'You're not forbidden from eating fish.'

However, unlike the permissive particle *euš*, this construction is highly distancing and heavily implicates that the speaker isn't the relevant one when it comes to deciding whether the thing in question is permitted or forbidden.

Iz is also used to mean 'no' when the speaker is saying it in a forward-thinking context in which they want to prevent some future eventuality from happening via their 'no'.

3.2.5 Permissive—*euš*

The permissive particle *euš* is appended to the end of a sentence to indicate that the speaker is allowing the hearer to do something (typically but not always what the sentence overtly describes) but doesn't have any strong feelings one way or the other, positive or negative. It's the Geoboŋ equivalent of shrugging and saying 'Sure, I don't really give a shit,' but is also more widely used to indicate that the hearer may do something but isn't necessarily being encouraged to do that thing.

(60) *Žleuoh ďeoś pogebim   euš*
child   tree climb:>3.INAN PERM

'Children (you) may climb trees.'

Like many of the other particles, it can be used with a simple noun in many contexts.

(61) Q: Would you like something to eat or drink?

A: *Teułb   euš*
still_water PERM

'Water's fine.'

Like related particles, it can also be used with more opaque sentences if context makes it clear what's being permitted.

Scoping negation over the permissive particle is done via embedding with the verb *eułś* 'to permit.'

(62)   *Deoł žleuoh ďeoś pogebim   euš   , as čos   es   eułśogźar*
        C   child   tree   climb:>3.INAN   PERM   C   INS:3.ABSTR   3.ABSTR   permit:NEG.INV:>2

        'Children (you) are not allowed to climb trees.'

While this may seem at first glance to be identical to the use of the prohibitive particle, it doesn't constitute a direction illocutionary prohibition the way *iz* does. Instead, it comes off as a statement about the way things are and thus strongly implicates that the speaker is not the one in control of whether the hearer is permitted or prohibited from doing whatever is described.

Euš is also used as an equivalent for 'yes' when the speaker wants to express lethargy or apathy towards their agreement.

3.2.6   Positive Attitude—*ip*

The positive attitude particle *ip* is appended to the end of a sentence to indicate that the speaker has a positive outlook on the eventuality described by the sentence in question—that they believe that eventuality is/was good, fortunate, natural, and/or just.

(63)   *Škrik   es   uheog   ip*
        Skreek   3.ABSTR   kill:>3.GOB   :-)

        'Yay, Skreek died!'

Ip is also used as an equivalent for 'yes' when the speaker wants to express enthusiasm or an otherwise positive attitude toward their agreement.

3.2.7   Negative Attitude—*huł*

The negative attitude particle *huł* is appended to the end of a sentence to indicate that the speaker has a negative outlook on the eventuality described by the sentence in question—that they believe that the eventuality is/was bad, unfortunate, unjust, unnatural, or otherwise unnacceptable.

(64)   *Škrik   es   uheog   huł*
        Skreek   3.ABSTR   kill:>3.GOB   :-(

        'Oh no, Skreek died!'

Huł is also used as an equivalent for 'yes' when the speaker wants to express a negative attitude toward their agreement.
